effects. It should be pointed out, however, that the use of the best-fit asymptotic growth curve (Eq. 2) to model the data in Fig. 2b may have introduced bias. As the asymptotic growth rate of the control group ( $\lambda_{\text{control}}$ ) is 20% greater than the value of  $\lambda_{\text{test}}$ , some error in interpretation of the growth data from the treated and untreated fish may be introduced, with a possible bias towards the control fish.

The results indicate that the difference in growth rates between the fish fed the test and control diets (Fig. 2b) may be due to some interpretation of the previous data, and may be further complicated by the relatively small growth differences (Fig. 2a) between the two groups.

[illegible]

let  $\{T_n\}_{n \in \mathbb{N}}$  be a sequence of independent random variables such that  $T_n \sim \text{Exp}(\lambda_n)$  for all  $n \in \mathbb{N}$ . Then, the sequence  $\{T_n\}_{n \in \mathbb{N}}$  is a sequence of independent random variables.

Also, Naylor, professor in the University of California at San Diego, says that "combining genetic and behavioral research is a promising, but as yet unexplored, field that will allow us to understand the developmental and environmental processes that lead to the onset of mental illness."
